

Z80 Microprocessor Kit

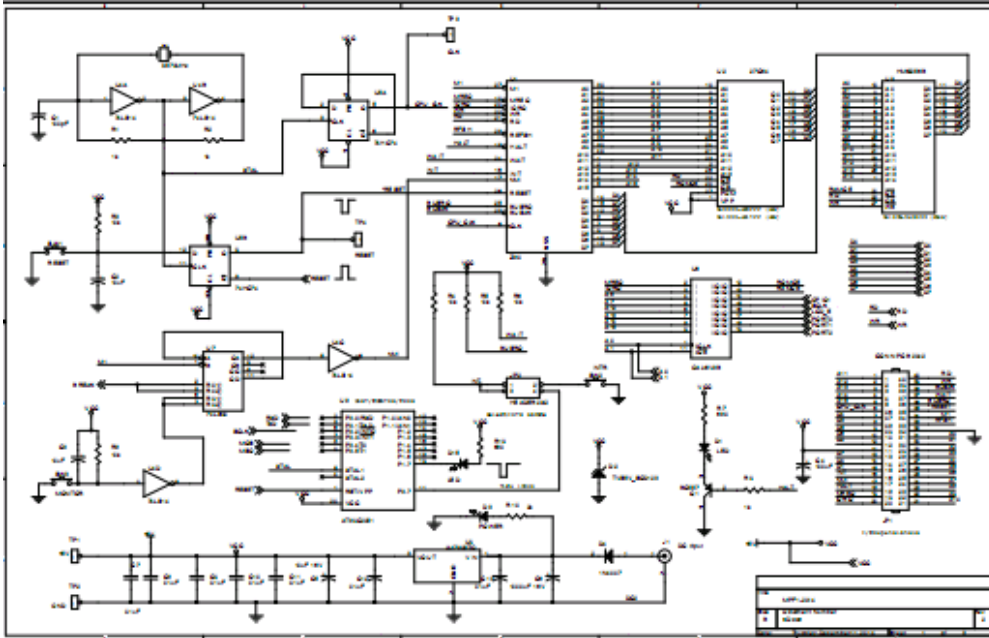

Wichit Sirichote, wichit.sirichote@gmail.com

Build a single board computer with a popular Z80 microprocessor. Best tool for self learning the basic of today's computer.

The Z80 Microprocessor Kit is designed for self-learning how to build and how to program the Z80 microcomputer. The design concept uses a small number of chips, only CPU, ROM, RAM and cheap I/O ports using CMOS latch and buffer IC. The monitor commands are compatible with MPF-1 board plus additional HEX file upload/download commands. The 8-bit dot LED is designed for displaying 8-bit binary number directly. Under program testing, it will be used to display the content of accumulator register. The microcontroller, 89C2051 provides 10ms system tick. It can be used for time trigger event. The kit is suitable for self learning the basic of today's computer with low level programming by HEX code and c programming by sdcc, free c compiler for Z80.

Hardware schematic of the Z80 Microprocessor Kit (click to enlarge)

Hardware features:

- Microprocessor: Z80, 40-pin DIP package
- Memory: 4kB monitor ROM, 32KB user RAM
- Memory & I/O Decoder logic: GAL16V8
- System tick: 10ms produced by AT89C2051 microcontroller
- GPIO: 8-bit LED display
- DISPLAY: 6-digit 7-segment super bright display
- Keypad: 36-key
- Serial port: 2400 Bit/s RS232 using software UART
- Expansion slot: 40-pin header
- LCD bus: 16x2 text display direct bus interface.

The monitor software features:

- MPF-1 compatible monitor commands and utilities subroutines
- UPLOAD/DOWNLOAD Intel Hex file.

Z80 kit with HD44780 compatible LCD

DIY kit

Building a computer is easy and fun. The kit includes PCB, IC chips with sockets, resistors, capacitors, LED, key switches and speaker. The preprogrammed chips are monitor rom, PLD, and microcontroller. The [construction manual](#) provides steps to assemble it. The [lab book](#) is for self-learning how to program the Z80 with machine language.

Recommended reading for Z80 hardware and instructions.

The Z80 Microcomputer Handbook by William Barden Jr.

Write your own monitor program with sccc compiler

The new monitor program for Z80 microprocessor kit has been developed using c language and assembly code. The monitor ROM is now located at 0x0000 to 0x1FFF, 8kB. The user RAM is started at location 0x2000-0x9FFF. Most of hex key functions are similar to MPF1. The initial powerup also shows uPF--1. The PLD equations have been modified for the new memory layout. The I/O locations are the same as old version. The monitor source code is available for learning and modification at download section.

Now with the pre-installed text LCD, the monitor will write the boot message to the LCD automatically.

The current location on power up will be 0x2000.

Here is the new layout key. Click the image to get vector file.

The new DUMP key will dump the memory contents to terminal.

Z80 MICROPROCESSOR KIT SDCC v3.3.0
Connect 2400 bit/s terminal loopback test

```

Key TEST for #2 will be loopback test. Any typing on terminal will be echoed on screen.

User may learn the source code and add more test functions easily.

PLD equation has been modified for the new memory layout.
